

## Case study : BEA Desio (Italy)

|                                    |  |
|------------------------------------|--|
| <b>Name of the project:</b>        | Desio  |
| <b>Address of the project:</b>     | Desio  |
| <b>Name and type of the owner:</b> | DH supplier  |
| <b>Owner contact person:</b>       | Giorgio Tominetti (giorgio.tominetti@beabrianza.it)<br>Alessandro Parolari (alessandro.parolari@beabrianza.it) |

### A/ Context of the study

#### A.1/ Motivations

Planning to extend the existing DH network, BEA DESIO wants to increase the thermal energy capacity of the network in a renewable way. Furthermore, they want to make first experiences with solar thermal systems. This study is in between 3.1 and 3.2, as the plant would be connected to the existing grid, which though will be extended in the near future.

#### A.2/ Description of the existing DH

The district heating pipelines extend for about 20 km (both supply and return pipes). The heating needs of the district heating is provided by 3 boilers of 10 MW each (30 MW total) and by steam bleeding system from the steam turbine. In this network are also present 2 condensers (total power=16 MW) that work simultaneously (one is an air-condenser, while the other one is water-condenser). There are also some absorption chiller used in summer along the network and 800 m<sup>2</sup> heat storage. Electricity production and condensation are lower in winter, due to the higher use of DH (2,5 MW in winter, 4 MW in summer).

##### Temperature and flow

###### **in winter:**

- Tforward 92 °C
- Treturn 68 °C
- Flow (nominal) 550 m<sup>3</sup>/h
- Flow (max) 700 m<sup>3</sup>/h

###### **in summer:**

- Tforward 92 °C
- Treturn 68 °C
- Flow (nominale) 250 m<sup>3</sup>/h

The total annual thermal energy consumption has been **49 GWh**.

### A.3/ Environment data

For what concerns the weather conditions, we used Meteonorm (meteonorm.com) hourly data of air and ground temperatures, air relative humidity and solar irradiation in Milan. Here a summarizing table of average monthly conditions:

| MONTH                           | 1    | 2    | 3    | 4    | 5    | 6    | 7    | 8    | 9    | 10   | 11   | 12   |
|---------------------------------|------|------|------|------|------|------|------|------|------|------|------|------|
| n° Days                         | 31   | 28   | 31   | 30   | 31   | 30   | 31   | 31   | 30   | 31   | 30   | 31   |
| n° Hours Day                    | 278  | 283  | 359  | 395  | 456  | 450  | 465  | 424  | 373  | 326  | 284  | 279  |
| n° Hours Night                  | 466  | 389  | 385  | 325  | 288  | 270  | 279  | 320  | 347  | 418  | 436  | 465  |
| T ext. air max [°C]             | 11.8 | 16.6 | 18.0 | 21.2 | 25.5 | 29.8 | 32.2 | 30.7 | 29.2 | 23.1 | 17.5 | 12.4 |
| T ext. air min [°C]             | -7.4 | -6.9 | -4.3 | -1.4 | 4.7  | 8.3  | 11.7 | 11.0 | 7.9  | 1.8  | -3.8 | -7.3 |
| T ext. air ave [°C]             | 1.6  | 3.2  | 7.2  | 10.5 | 15.6 | 19.2 | 22.3 | 21.7 | 18.1 | 12.3 | 6.0  | 2.2  |
| T ground ave [°C]               | 14.0 | 12.7 | 11.8 | 11.4 | 11.7 | 12.6 | 13.9 | 15.3 | 16.2 | 16.6 | 16.3 | 15.3 |
| Relative Humidity [%]           | 83.8 | 78.4 | 72.0 | 76.5 | 72.7 | 72.9 | 71.6 | 72.8 | 75.4 | 79.6 | 83.6 | 84.0 |
| Irr max H [W/m <sup>2</sup> ]   | 420  | 562  | 713  | 864  | 901  | 923  | 897  | 897  | 762  | 600  | 408  | 312  |
| Irr ave H [W/m <sup>2</sup> ]   | 117  | 178  | 267  | 327  | 355  | 398  | 404  | 385  | 312  | 223  | 126  | 99   |
| Rad tot H [kWh/m <sup>2</sup> ] | 33   | 50   | 96   | 129  | 162  | 179  | 188  | 163  | 117  | 73   | 36   | 28   |

### A.4/ Opportunities and barriers

OPPORTUNITIES: very high motivation in solar DH and also availability of land owned by DH supplier near the power station

## B/ Methodology and tools used in the study

### B.1/ DH load profile

A detailed load profile (with a timestep of 2 hours) has been provided directly by the DH supplier and used as input for a TRNSYS simulation, which calculated the solar energy input into the grid on hourly basis, including return temperature increase.

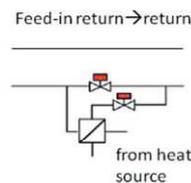

### B.2/ SDH design and sizing, energy balance

The design of the SDH is "feed-in return-->return".

We used TRNSYS because it is more flexible than other softwares (e.g. TSOL): it's easier to put the meteo data as an input file. We also take the hypothesis to model the solar collector like one single, big collector. Collector area is 1000 m<sup>2</sup>, as this is the maximum area benefitting from incentives in Italy.

The energetic indicators we have taken are:

- solar energy produced by the solar thermal system ( $E_{sol}$ );
- efficiency of the plant ( $\eta_{plant}$ );
- solar fraction ( $f_{sol}$ ).

### B.3/ Economics

Simple pay-back time. This indicator has been calculated taking into account that solar energy increases the amount of electricity produced by the waste incineration plant, which benefits from green incentives.

## C/ Results of the study

### C.1/ SDH system design, energy balance and performance

Results of the study are shown in the following table:

|                          |     |      |
|--------------------------|-----|------|
| <b>E<sub>sol</sub></b>   | MWh | 412  |
| <b>η<sub>plant</sub></b> | %   | 32   |
| <b>f<sub>sol</sub></b>   | %   | 0.83 |

### C.2/ Heat production management at network level

The objective was to limit the return temperature on the network, in order not to disturb the waste incineration plant. Due to the relatively small collector size, the temperature increase turned out to be limited and acceptable.

### C.3/ Economics at SDH level and at network level

The cost of 1000m<sup>2</sup> of solar collector is about 267'000€. This value is between 200€/m<sup>2</sup> and 400€/m<sup>2</sup> that represents the unit cost of typical ground installation in Europe. Considering the ground purchase, the infrastructural costs and some other items, the amount on the solar plant is 317'000€.

Since in Italy there are national incentives, for 1000m<sup>2</sup> of solar collector there are 275'000€ distributed in 5 years.

Adding all the items shown before, the total investment, after 5 years is 42'000€.

The energy produced by the solar plant allow the turbine to produce more electrical energy, with the benefit of 9'300€ more every year.

The pay-back time (simple) has been calculated by BEA and is 4.5 years.
