## Solar District Heating in Hamburg-Bramfeld – Experiences with Pre-insulated Bonded Pipes and Solar Feed-in

- Germany's oldest SDH system with seasonal heat storage in Hamburg
- Damage in the solar network
- The multifunctional heat storage
- Solar feed-in model in Hamburg

## Damage in the solar network, 2008

In 2008: damage in the solar network with multiple leakages

- Statically overstressing of the pre-insulated bonded pipes caused by high number of load cycles in the solar net (more than 500 per year)
- Overstressing of the pipe compound by overheating of collector fluid (above 130°C) and occasionally steam pressure shocks
- Decomposition of pipe bonding (steel pipe, heat insulation, liner pipe) with a loss of static stability of the pipe construction.
- Damaged pipe fittings (due to poor workmanship) led to a wetting of heat insulation and corrosion of steel pipes.

## Additional findings

Expert team of consultancies, producers and scientists:

- Recalculation of static stability according to up-to-date standards with 500 load-cycles per year shows that the solar network lasted longer than it should.
- Temperatures of the pipe compound above about 130°C have to be avoided definitely.
- Pre-insulated bonded pipes seems to be usable for solar networks if dimensioning of static system considers special "solar conditions"
- As an alternative pre-insulated bonded pipes without active static compound might be used (e.g. with double layered mineral wool as heat insulation)

### Multifunctional heat storage in Hamburg

- Germany's first seasonal thermal energy storage was reconstructed to a multifunctional thermal energy storage (4.100 m<sup>3</sup>)
- A separate steel tank installed inside the former building turned out to be the most economic solution
- Advantages for the owner E.ON Hanse Wärme GmbH :
  - Higher efficiency of the storage
  - Peak load storage of CHP waste heat in winter
    - Increase of CHP fraction
    - No inefficient peak load boilers necessary in the heating season
  - Possibility for the integration of large scale solar thermal systems into the district heating network
- Advantages for housing companies in the service area:
  - Cost-effective solar thermal systems
  - Favourable primary energy factors for the buildings

### Solar feed-in model in Hamburg, 2011

- E.ON opened the wide-spread district heating network in eastern Hamburg for feeding-in solar heat.
- Operators of solar thermal collector plants larger than 100 m<sup>2</sup> have the possibility to feed their heat into the network for transportation and storage.
- The heat can be stored in the network for a time period up to 8 months (heat losses are not taken into account). This means that solar heat produced in summer can be used in winter.
- Surplus solar heat in the network can be stored in a 4,100 m<sup>3</sup> underground tank.
- For the storage service E.ON charges a service fee to the customer.  
The price announced in 2010 was 2.1 – 2.5 Ct/kWh.

## Example of solar feed-in by TRNSYS-simulation

Boundary conditions of the simulation:

place	Frankfurt am Main (Germany)
set temperature sekundary circle	73 °C
set temperature primary circle	40 °C
collectortype	high temperature flat plate collector
collector azimuth	0°
collector slope	30°
collector aperture	100 m <sup>2</sup>
